PRIME REGISTRY™

Improving America's Health

Report of the Month:

Promoting Interoperability - Individual

Learn how the PRIME Registry Promoting Interoperability – Individual report can help you prepare for submitting QPP/MIPS measures.

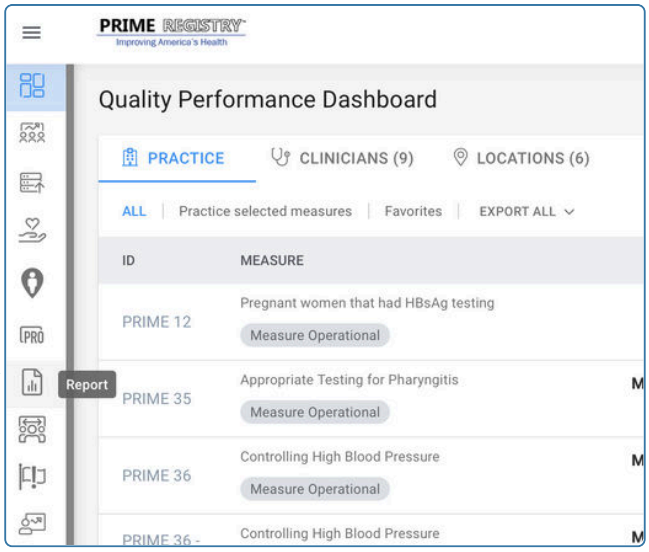
The measures in the MIPS Promoting Interoperability (PI) performance category emphasize the use of electronic health record technology to make it easier for patients to access their health information, and for information to be exchanged between healthcare providers. These measures are available for reporting through the PRIME Registry's MIPS dashboard.

Dr. Sandra Myers is an enthusiastic supporter of health IT to ensure that her patients have easy access to their health information, and that other clinicians can share critical health data across locations and practices, improving and simplifying health information exchange and patient outcomes.

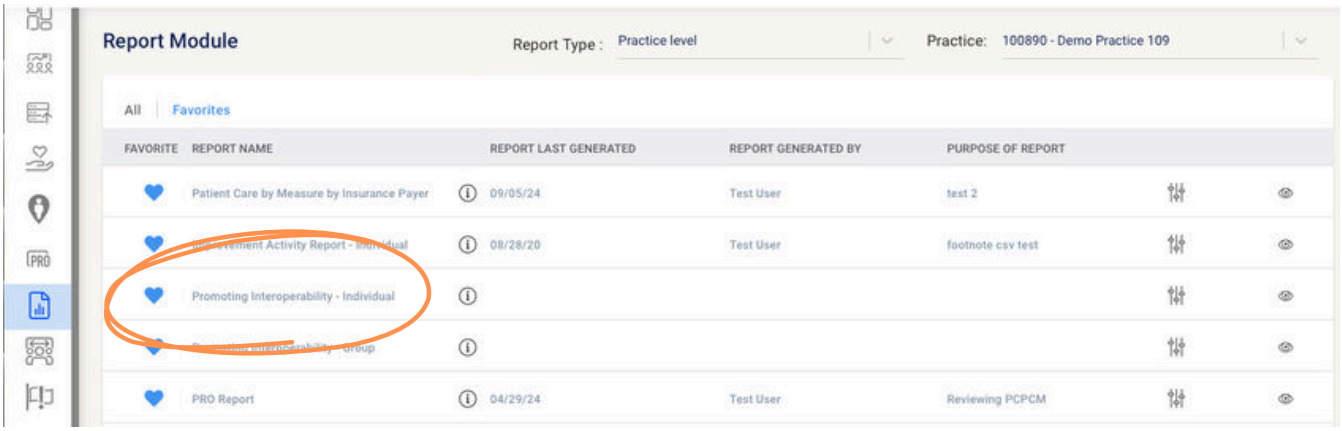
Dr. Myers uses the Promoting Interoperability – Individual report to keep track of her performance on those measures on a monthly basis, rather than looking at the performance right before she needs to submit her MIPS reporting. With the reports tool, she can check that PI measures are met at the individual level, and have the data for all the measures in one report. This helps her ensure that the data is correct for those measures, and her payment adjustment reflects the great work she is doing to facilitate interoperability.

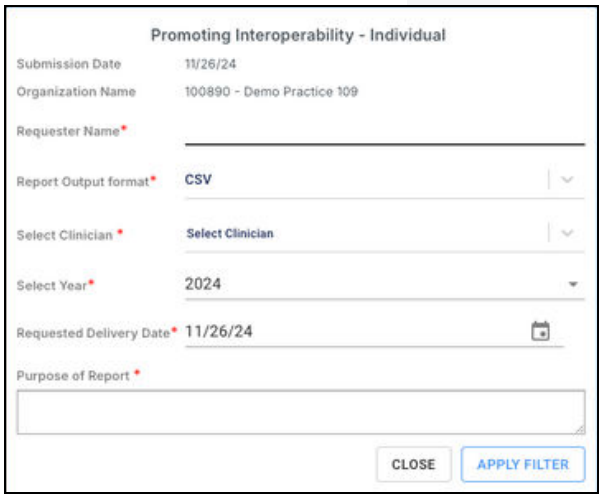
To access the report, she logs in to the PRIME Quality dashboard, and navigates to the report module by selecting the Report icon in the left hand navigation pane. (See screen shot, next page.)

The Report icon is in the left hand navigation pane.



She locates the Promoting Interoperability - Individual report in the list view.



Next, she selects the **filter icon**, in the bar to the far right of the report title.


A window pops up, where it's easy to customize the report. She can choose report output formats--**xls, csv, or PDF,** and select the measures and locations she wants to view, along with the time period she wants to review. She selects the current date as the report delivery date, so the report will generate and be available within seconds. She can also set up the report to run every month, simply by selecting the filter icon again, and setting up reports with a requested delivery date for each future month.
